Users with double or multiple monitors will note the “Preview 2x” and “2x” options. Either of those allows you to duplicate your image at 2x magnification so that you can see and work on it at half resolution. If you’re a delicate-handed tradesman, then you might be careful enough to refrain from using the 2x button. Most folks will find that a practical option for checking details at half resolution. But if you’re like me, then I’d take advantage of the magnification technique as often as possible. Several new features have been implemented to help you create dynamic compositions of your own. A Smart Stroke feature is meant to make all the photo editing chores that are inherent in a photograph (changing color, adding depth, etc.) as easy to accomplish as applying a simple brush stroke. You can extend the Smart Stroke effect in various ways, such as by using the Liquify filter or the Puppet tool. You also have the ability to add layers within the effect and include multiple layers. However, this Smart Stroke effect isn’t perfect. It might break up images or overcompensate for the effects you might choose. It’s more of a selection-maker than it is an alternative to one. To be clear, there’s a new Layer Blur filter in Lightroom 5. It’s also the first filter to include a “Monochromatic” option. A Monochromatic option means that the finished image will have a color tint that will be different from the original. However, you can also now blur your secondary and tertiary Layers of your image. You can choose a “refractive blur” or a “Pixelize” blur.

The camera captures images only in black and white because it has no color sensitivity on its sensor. This means it could record everything in green, but, alas, this is not what the original scene looked like. The camera only recorded the original scene as black. In contrast, human eyes are color-sensitive, since they have a color-sensitive receptor in the retina of the eye. Hence, human eyes can record color images that have come from a scene. **What is Adobe Photoshop?** If you’re starting with a camera, you can either view the images on the camera’s monitor, or you can connect the camera or scanner to your computer for viewing. All of us would much rather dump the image we just took into a graphics editing application and correct things there. You don’t need much skill to make basic adjustments and corrections to a digital image. But if you’re just starting out, we recommend you dive into a little computer graphics training. You will see why below. If you decide to scan your images into your computer, you can either use a scanner that attaches directly to your computer or create a portable scanner. All scanners, whether attached directly to the computer or portable, have two sides: the **front** and the **back**. If your scanner has one side only, you’re better off leaving it on the back side. Never try to view a scanned image on the front side of the scanner or anything connected to it. Once you have your digital images on your computer, you are ready to start the process of correcting them and adjusting them to your liking. We’ll explain what and where all the buttons and tools are located in the menus on your operating system’s screen, and how you use them. e3d0a04c9c
