Adobe Photoshop is still one of the most powerful image editing software on the market. The excellent image manipulation software is still owned by the same company that invented the term “photoshop.” Photoshop continues to evolve and has added dozens of new features. Beginning with Photoshop CS2, the program introduced the “open palette” feature, which allowed for access to image processing features immediately, rather than waiting for a separate plug-in to load. This idea was instrumental in its continued success. Similarly, Photoshop CC 2019 is going to introduce powerful AI tools to quickly create stunning designs. Photoshop continues to cede ground to other software, to the point that the program now has a lower share of the market than it did several years ago with the release of Photoshop Elements. In fact, according to figures released by Adobe a few years ago, Photoshop now accounts for only 1 of every 10 image-editing tasks. Capture One was introduced in 2013 to take over the lower-end markets that Elements never reached. The new features available in Photoshop CC 2019 will include Crop-Computer Vision, Crop-Lens Optimization, and Camera Raw (for creating RAW images). Creative Cloud members will also be able to make their own presets, such as B&W, Sepia, and Vibrant, and the software will include a new Target Merge feature that will allow for edits to be made on several layers at once. Adobe has also tweaked the cloud-based storage feature, and it has now been enhanced with In-Pixel Editing. In-Pixel Editing will let users modify specific pixels on an image, rather than altering those pixels in the whole image.
